Platform for collaborative experiences

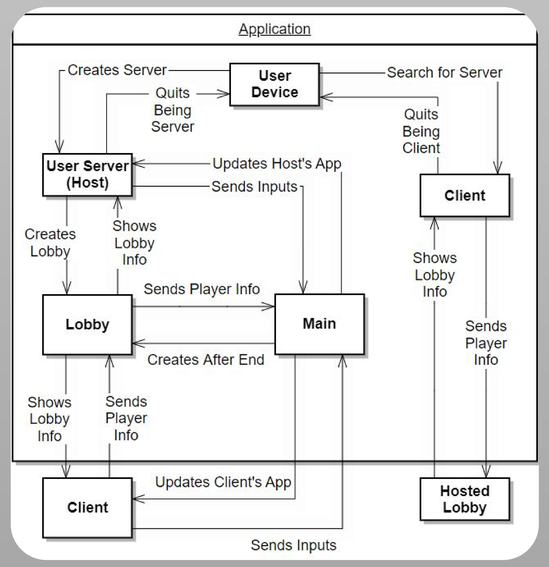
Team: Coleman Darnall, Alex Johns, John Thomas
Advisor: Dr. Chris Branton

DRURY UNIVERSITY 1873

Introduction

This project is a client server platform/application in collaboration with the Drury Theater Department. This involved the development of a platform that would allow users to interact with the movie known as School Spirit. Two separate applications were created in order to test the platform under different circumstances.

Architecture



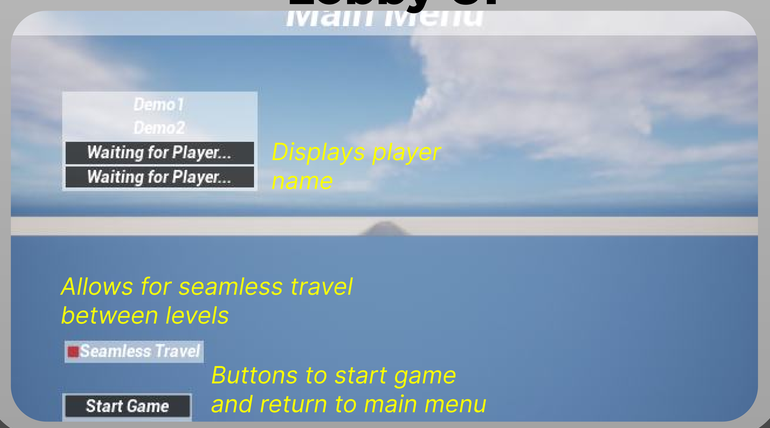
School Spirit

Once the server had been tested and working, we created a new project to build the School Spirit app in.
This required a new system for the players to engage with compared to Steel Nightmare, which involves the App functionality as well as the connection to the movie.

Steel Nightmare

Steel Nightmare was developed as a starting point for how to develop and implement a listen server in Unreal Engine, which would evolve into a co-op horde shooter. The listen server is created when a player creates a lobby. They become the “host” of the match, while any players who join the lobby are “clients”.

Lobby UI



Future Plans

- Optimize phone Integration
- Put the scenes from the movie into the project
- QR-Code to download
- Local player profiles
- Separating the application into two apps

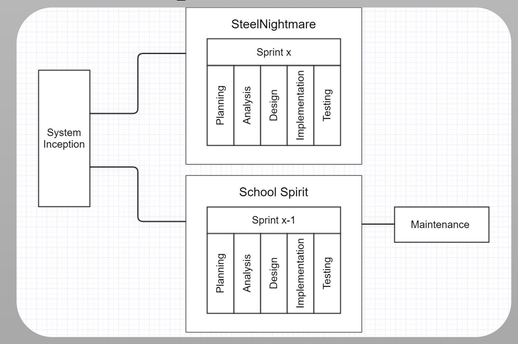
Voting UI

Count-down timer

Last Line in the scene

Buttons for voting

Development Process



This shows how we developed two projects simultaneously to understand and implement a listen server and adapt it based on the project.

Acknowledgments

We would like to than Brian Shipman and Taylor Stevenson for their contributions to the project.
